Introduction

Viral hepatitis is a major public health problem in Indiana. Nation-wide, it is estimated that more than 1.2 million people are living with chronic hepatitis B and at least 3.2 million people are living with chronic hepatitis C. In Indiana at least 6,314 people were reported in 2013 as having viral hepatitis. Many more persons may be infected and are likely not aware of it.

This Viral Hepatitis Resource Directory was prepared by the Indiana State Department of Health to inform the general community and health and human services providers about available viral hepatitis services in our state.

The directory provides information about a range of services, arranged by county, including:

- How to access prevention information
- Where to get vaccinated
- Where testing is available
- Which doctors or clinics provide medical care for people living with viral hepatitis, and,
- How to locate support services for people living with viral hepatitis.

Included in this guide is basic information about viral hepatitis and links to important resources throughout Indiana. The guide also includes a list of valuable Internet websites with important information on many topics related to viral hepatitis.

The information contained in this resource directory was obtained, through a survey, directly from the organizations listed herein. Only information provided by organizations was included. Any missing information will be shown as none or not applicable. It is possible that other services and providers may exist in the state of Indiana.

How to use this Guide

This guide is organized so that you can easily identify the services that are available in your county. Each county is listed in alphabetical order. Go to the table of contents to find the pages of the guide that include information about your county.

This guide is also set up to help a person who is living with viral hepatitis navigate through a process to learn about their health status and understand available resources and services. It can also be used by health and human services providers as they work with people affected by viral hepatitis.

This guide is intended to support Indiana Health Care Providers in providing appropriate care for those patients with hepatitis through provided education, resources and possible referral sites. Should you have questions or you would like more information, please contact the Viral Hepatitis Prevention Coordinator, Brittany Gross, at 317-233-7627 or bgross@isdh.in.gov.

Should you know of other resources within your community and would like them to be included in this resource guide, please contact Brittany.

This guide will be maintained and updated on regular basis, to provide you with the most current and accurate information; to provide updates to your organization, please contact Brittany.

Understanding Viral Hepatitis

The word "**hepatitis**" means inflammation of the liver and also refers to a group of viral infections that affect the liver. The most common types are Hepatitis A, Hepatitis B, and Hepatitis C.

Viral hepatitis is an important public health issue:

The chart on the next page describes how Hepatitis A, B and C are transmitted, how it can be prevented and what happens if someone becomes infected. Viral hepatitis prevention information is especially important because even though viral hepatitis is preventable, each year in the US it is estimated that 43,000 people will become infected with Hepatitis B, 17,000 will become infected with Hepatitis C and 25,000 persons will become infected with Hepatitis A.

Vaccines can prevent hepatitis A and B:

Vaccination is very effective at preventing hepatitis A and B. Hepatitis A vaccination is now a standard of care for all infants over 1 year of age and vaccination for hepatitis B is given to anyone 18 years old or younger and all infants at birth. Depending on the different types of vaccine, 2-4 doses are required to provide full protection.

People who were not vaccinated as children and who are at risk for viral hepatitis should be vaccinated as soon as possible. Adults who are at risk for viral hepatitis include:

- Immigrants from areas of the world with high rates of viral hepatitis
- People traveling to areas with high rates of hepatitis A or B
- Injection drug users
- Men who have sex with men
- People with multiple sexual partners
- People who are incarcerated
- People who received clotting factor before 1987
- Household members of people living with hepatitis B
- People living with HIV
- People living with liver disease.

Screening for Viral Hepatitis

The only way to know for sure if you have been infected with hepatitis A, B or C is to be tested. People are not routinely screened for viral hepatitis so even if a person has seen a doctor he or she should not assume that testing was done. There are different tests for each type of viral hepatitis. The decision about whether to get tested depends on a person's health behaviors and other factors which are described in the chart on the next page.

Hepatitis: The Silent Disease

Hepatitis is often called the silent disease because people will often have no symptoms. The symptoms of Hepatitis A, B and C, when they occur, are similar. The symptoms include: jaundice (skin turning yellow), nausea, vomiting, diarrhea, dark urine or pale stool, loss of appetite, fatigue or joint pain. Even though the symptoms are similar, one type of hepatitis does not progress to become another type of hepatitis – for example, hepatitis A cannot develop into hepatitis B.

Overview of Viral Hepatitis

Type of hepatitis	Hepatitis A	Hepatitis B	Hepatitis C
What body fluids can transmit the virus?	Feces	Blood, semen, vaginal secretions	Blood
What activities can pass the virus?	Eating food prepared by an infected person who did not wash properly after going to the bathroom; Eating uncooked shellfish Any contact between the mouth and an infected person's feces or anus	Unprotected sexual intercourse Sharing equipment used to inject drugs	Sharing equipment used to inject drugs Unprotected sexual intercourse, but this is less common
How it can be prevented?	Vaccination Early childhood vaccination was started in 1991. People who are at risk should be vaccinated	Vaccination Early childhood vaccination was started in 1991. People are at risk should be vaccinated	Avoid sharing injection drug equipment; use a new, clean syringe every time you inject Use condoms consistently and correctly every time you have sex
What happens if someone becomes infected?	Hepatitis A is a short term illness that clears on its own within 6 months No specific treatment is available except rest, drinking plenty of fluids, over the counter medications to control symptoms	About 85% of people who become infected with hepatitis B are able to clear the virus and will not have it for life. About 15% develop lifelong infection and approximately 15-40% of these people will develop liver damage (cirrhosis) or liver cancer over 10-25 years. Treatment is available to help slow the disease	About 20% of people who become infected with hepatitis C are able to clear the virus and will not have it for life. About 80% develop lifelong infection and approximately 5-20% of these people will develop liver damage (cirrhosis) or liver cancer over 10-25 years. Treatment is available with a success rate of about 50%

You can access important fact sheets and brochures with more information on the Indiana State Department of Health's Viral Hepatitis Prevention webpage, at <http://www.in.gov/isdh/25797.htm>

How to Integrate Hepatitis Prevention into Patient/Client Education

Talking about contraception? STDs? HIV? Drug use? Hygiene? Educating patients/clients who are at high risk about viral hepatitis can easily become part of your current practice. Here are some examples:

HEPATITIS A VIRUS	HEPATITIS B VIRUS	HEPATITIS C VIRUS
<ul style="list-style-type: none">• <i>Good hygiene (being clean) is important to your overall health.</i>• <i>Washing your hands with soap and water helps kill the germs that cause infections including hepatitis A.</i>• <i>Indiana offers free Hepatitis A vaccines for people under the age of 19.</i>	<ul style="list-style-type: none">• <i>Use a condom every time you have sex to prevent the spread of STDs such as gonorrhea, hepatitis B, or HIV.</i>• <i>Hepatitis B is 100 times more contagious than HIV, and can lead to liver cancer, cirrhosis, and even death.</i>• <i>Indiana offers free Hepatitis B vaccines for people under the age of 19.</i>	<ul style="list-style-type: none">• <i>If you shoot or snort drugs, don't share works (needles, cottons, cookers). Sharing works puts you at risk of getting HIV and hepatitis C.</i>• <i>Hepatitis C can cause liver cancer, liver scarring, and in some cases death.</i>• <i>There is no vaccine available for hepatitis C.</i>

Tips on Starting a Sensitive Conversation

To begin a conversation about viral hepatitis (or other STDs or HIV) ask:

"Have you ever heard about hepatitis? ..."

"What have you heard?"

"Do you know anyone who has hepatitis?"

"Do you know that hepatitis B is 100 times more contagious than HIV?"

Normalizing risky behaviors can help. Start your conversation with:

"People your age sometimes experiment with drugs and alcohol."

"Have you ever tried drugs?"

"Have you ever shared injection drug equipment or a straw to snort drugs?"

"Do you think people your age are practicing safe sex, for example, by using condoms to protect themselves from sexually transmitted diseases and pregnancy?"

Tips on Counseling

Sex practices and drug use are difficult topics to discuss—especially with youth. But it is important to provide everyone with information on how to protect themselves. Here are some tips to keep in mind when talking with patients/clients about practicing safe sex and reducing or stopping substance use.

- Assure patient confidentiality.
- Listen to your patient.
- Accept that your patient/client's values may be different from your own.
- Avoid judging a patient/client's personal behaviors.
- Be sensitive to expressions and gestures (both yours and your patient/client's).
- Help your patients explore their options for reducing or stopping unsafe sexual or substance-using behaviors.

Assessing Patient Risk

Ask patients/clients to respond to the following statements to quickly assess their hepatitis risk level:

<i>I wash my hands with soap and water before eating and after going to the bathroom. (Hepatitis A)</i>	Yes	No
---	-----	----

<i>I use a condom every time I have sex. (Hepatitis B or C)</i>	Yes	No
---	-----	----

<i>I have never injected or snorted drugs. (Hepatitis C)</i>	Yes	No
--	-----	----

Patients who answer "no" to any of these questions may be at risk for viral hepatitis.

What to Tell Patients/Clients Who are at Risk

All patients/clients, but especially those who are at risk, should learn about viral hepatitis. Our conversations with teens and others showed they want to know what viral hepatitis is and how to prevent it. When talking to patients/clients, the use of meaningful statistics can have a powerful effect.

Example: Hepatitis B is 100 times more contagious than HIV.

Tell patients/clients who are at risk to:

- *Get immunized against both hepatitis A and B.*
- *Use a latex condom every time you have sex.*
- *Never share works with anyone if they shoot or snort drugs.*
- *Wash their hands with soap and water often and thoroughly.*
- *Only get tattoos or ear, tongue, and other body piercings from licensed facilities.*
- *Your local health department can tell you if a facility is licensed.*
- *Avoid contact with someone else's blood (e.g. cuts or scrapes), and don't share razors, toothbrushes, or anything else that may have blood on it.*
- *Avoid eating raw shellfish.*

Testing Information

Once a patient/client has been identified as being at high risk for viral hepatitis infection, testing should be considered. The CDC recommends testing for hepatitis, and immunizing against hepatitis A and B. For more information visit, <http://www.cdc.gov/hepatitis> Testing for hepatitis in Indiana is confidential. To help your patients locate a testing site in their area, or call your local health department.

Immunization Information

- *Hepatitis A and B immunizations are recommended for all who are at risk.*
- *People infected with hepatitis C should receive hepatitis A and B immunizations to prevent further liver damage.*
- *There is no immunization available against hepatitis C.*

Most youth have received the hepatitis B immunization as a newborn, or in school through Indiana's "Vaccinate Before You Graduate" Program. However, there are still many youth and adults who have not been immunized against hepatitis B.

Ask the patient/client you serve if they know their hepatitis immunization status, and check their immunization record. If an immunization record does not exist, start one for them.

Cost and availability

Indiana offers hepatitis A and B immunizations to at-risk clients seeking STD services in all Indiana STD clinics. An STD exam may be required and a small administrative fee may be charged.*

*Charges are waived for inability to pay.

For more information on Immunizations, please visit the Indiana State Department of Health's Immunization website at <https://secure.in.gov/isdh/17094.htm>

Accessing Services: Different Types of Services

1. **Prevention education and interventions** – Some organizations listed in this directory can provide brochures, information and counseling about how to avoid infection with viral hepatitis. Some organizations may offer free condoms or other prevention resources.
2. **Vaccination** – Some organizations listed in this directory can provide vaccination against Hepatitis A and B. Some organizations may offer the screening free of charge and others may require the individual to pay a fee.
3. **Screening** – Some organizations listed in this directory can provide screening to help a person learn whether they are infected with viral hepatitis. Some organization may offer the screening free of charge and others may require the individual to pay a fee.
4. **Treatment** – Some hospitals, clinics and doctors listed in this directory provide treatment for people living with chronic hepatitis B or C. These facilities may or may not accept private insurance or Medicaid. Some facilities may provide care free of charge to individuals without coverage. It is important to consult with the facilities about how they handle reimbursement for their services.
5. **Support services** – Some organizations listed in this directory provide support services for people living with viral hepatitis. This may include hosting support groups, individual counseling, case management services and other types of social or emotional support.

Accessing Services: Locations by County

Allen, Bartholomew, Benton, Blackford, Boone,
Carroll, Cass, Clark Clay, Clinton and Crawford

Adams County

Organization: Adams County Health Department
313 Jefferson, Rm 320
Decatur, IN 46733
260-724-5326

Target population: All

Clinical Services Provided: Not applicable

Insurance Accepted: Uninsured

Types of Client visits: Appointments;
Walk-ins;
Referrals from other agencies

Hours of Operations: M-F

Types of Support Services Provided:
None

Hepatitis Testing and Screening Services Provided:
Screening for viral hepatitis risk factors

Hepatitis Prevention Services Provided:
Vaccination for Children for Hepatitis B;
Free Condoms

Hepatitis Treatment Services Provided:
Referrals for Hepatology/ Gastroenterology

Hepatitis Educational Services Provided:
None

Languages in which Services are Provided:
English only

Service available for Non-English speaking clients:
None

Allen County

Organization: AIDS Task Force, Inc.
525 Oxford Street
Fort Wayne, IN 46806
260-744-1144
www.aidsfortwayne.org

Target population: HIV positive individuals and persons at an increased risk for HIV infection

Clinical Services Provided: Not applicable

Insurance Accepted: Private;
Medicare/Medicaid;
Uninsured

Types of Client visits: Appointments;
Walk-ins;
Referrals from other agencies

Hours of Operations: Monday through Friday from 8:30 a.m. to 5:00 p.m.

Types of Support Services Provided:

Case management;
Drug & alcohol recovery,
Service referral (food, housing, etc.);
HIV positive people who are co-infected with Hepatitis B & Hepatitis C

Hepatitis Testing and Screening Services Provided:

None

Hepatitis Prevention Services Provided:

Free condoms;
Substance abuse services for Hepatitis B & Hepatitis C infected persons

Hepatitis Treatment Services Provided:

Care coordination for hepatitis B & C infected persons
Counseling Services for Hepatitis B & C infected persons

Hepatitis Educational Services Provided:

Develop hepatitis educational materials
Distribute hepatitis educational materials
Health education programs for clients with Hepatitis B and/or hepatitis C infection

Languages in which services are provided:

English
Burmese
Spanish

Services available for non-English speaking clients:

Multilingual staff;
Interpretation Services;
Health education materials translated into multiple languages

Organization: Fort Wayne-Allen County Department of Health (10)
4813 New Haven Avenue
Fort Wayne, IN 46806
260-449-7504 (HIV, STD, TB)
260-449-7514 (Immunizations)
www.allencountyhealthHepatitis.com

Target population: Those in need;
The STD clinic focuses on high risk populations, such as youth,
African American, Men who have sex with men (MSM), and
substance users

Clinical Services Provided: STD/HIV Clinic, Infectious Disease Clinic/Refugee Clinic, Lead Clinic, Immunization Clinic, Traveler's Clinic, Satellite HIV Counseling and Testing Sites

Insurance Accepted: Medicare/Medicaid;
Working toward accepting other types of insurance; Minimal Fees in the clinics, HIV satellite test sites are no charge.

Types of Client visits: Appointments;
Walk-ins;
Referrals from other agencies;
Referrals are typically pre-arranged appointments

Hours of Operations: Monday- Friday, 8AM-5PM. Closed most federal holidays.
Phones open at 9AM

Hours for Walk-ins: Walk-in Clinics are M, W, F afternoons: 1-4PM and Tuesday mornings 8:30AM -noon. Appointments are set all other times by calling one day in advance.

Types of Support Services Provided:

Case management;
Service referral (food, housing, etc.)

Hepatitis Testing and Screening Services Provided:

Screening for viral hepatitis risk factors;
Hepatitis B testing;
Hepatitis C Antibody testing;
Hepatitis C Confirmatory testing

Hepatitis Prevention Services Provided:

Vaccination for children for Hepatitis B;
Vaccination for adults for Hepatitis B;
Free Condoms;
Substance abuse services for Hepatitis B & Hepatitis C

Hepatitis Treatment Services Provided:

Counseling Services for Hepatitis B & Hepatitis C;
Phlebotomy on Site for Hepatitis B & Hepatitis C

Hepatitis Educational Services Provided:

Distribute hepatitis Educational materials for Hepatitis B & Hepatitis C;
Health education programs for clients for Hepatitis B & Hepatitis C;
Training for clinical staff for Hepatitis B & Hepatitis C;
Support Groups for Hepatitis C

Languages in which services are provided:

English;
Burmese;
Spanish;
Other languages accommodated as needed

Services available for non-English speaking clients:

Multilingual staff;
Interpretation Services;

Health education materials translated into multiple languages;
Multilingual videos on various public health topics

Organization: Neighborhood Health Clinics
1717 S. Calhoun
Fort Wayne, IN 46806

Living with Hepatitis C

An important purpose of this guide is to provide concrete information about services available for people living with hepatitis C. If you have recently tested positive for hepatitis C, know that you are not alone. In Indiana at least 6,314 people were reported in 2013 as having viral hepatitis. Many more persons may be infected and are likely not aware of it.

Know your HCV Status

The only way to know for sure if you have hepatitis C is to get tested. Some of the screening sites listed in this guide may offer antibody testing for hepatitis C. In about 20% of the cases of hepatitis C, a person's body is able to fight off the infection and clear the virus. This means, the person may test positive for antibodies but may not have lifelong infection. In order to know if you have lifelong infection (also called chronic infection) it is important to have a confirmatory test, such as an HCV viral load test.

Get Medical Care

Hepatitis C is known as a "silent epidemic" because people can live with the infection for many years without any noticeable symptoms. People with chronic hepatitis C should be monitored regularly for signs of liver disease. Even though a person may not feel sick, damage to the liver can still occur. People with hepatitis C should get medical care that includes:

- An initial physical exam and medical history
- Liver function tests
- Viral load and genotype testing
- Vaccination for hepatitis A and B
- Routine health maintenance and evaluation for other problems such as diabetes, high blood pressure and other diseases.

To evaluate the health of your liver, your medical provider may want to conduct an ultrasound or biopsy of your liver.

Talk with your Provider about Treatment

Antiviral medication can be used to treat some people with hepatitis C but not everyone needs or can benefit from treatment. The decision to undergo treatment is an individual one that you would make in consultation with your medical provider.

Reduce Alcohol Consumption

One of the most important steps that all people living with hepatitis can take to protect their health is to reduce or eliminate alcohol consumption. Even small amounts of alcohol, 2-3 drinks per day, may speed up liver damage in people with hepatitis C. People living with hepatitis C should talk with their doctor before taking prescription or over the counter medications, herbal supplements or vitamins. It is important to avoid large amounts (2000 mg) of acetaminophen (Tylenol and other non-aspirin pain relievers) because they are toxic to the liver.

Learn About How to Maximize Your Health

Other important steps that can help improve health and quality of life for people living with HCV include: eating a healthy, balanced diet, drinking plenty of water, getting 8 hours of sleep each night, getting exercise, and taking steps to reduce stress.

Step by Step Guide: Living with Hepatitis C

If you are living with chronic hepatitis C there are a number of helpful websites and brochures to help you navigate through the process of learning your status to accessing care and treatment:

HCV Advocate

The HCV advocate is a national organization with expertise around HCV. Their website provides information on hepatitis C treatment options, articles, newsletters and a host of resources for people living with HCV.

<http://www.hcvadvocate.org/>

Specific materials of interest from HCV Advocate include:

First Steps for Living with HCV

Brochure prepared by the HCV Advocate. Offers suggestions for managing the early phases of living with an HCV diagnosis.

http://hcvadvocate.org/hepatitis/First_Steps.asp

Guide to Healthy Living with HCV

Brochure prepared by the HCV Advocate. Provides a guide for living with HCV.

http://hcvadvocate.org/hepatitis/factsheets_pdf/Healthy%20Living%20Guide_09.pdf

Hepatitis C Caring Ambassadors

The Hepatitis C Caring Ambassadors Program mission is to improve the lives of people living with hepatitis C through information and awareness.

<http://www.hepcchallenge.org/>

Hepatitis C Choices:

Hepatitis C Choices is a book available online to help people living with HCV become the best possible advocate for their own healthcare. It provides useful information to help you make treatment and lifestyle choices that are right for you.

<http://www.hepcchallenge.org/choices/disclaimer.htm>

Hep C Primer

Find answers to your most pressing Hep C and liver support questions. Award-winning site developed by a patient to help you learn the facts

<http://www.hepcprimer.com/>

Transportation Needs

Many persons struggle with transportation to and from health care provider appointments and those with a hepatitis diagnosis are no different. In fact, these persons can have even more challenges as seeking medical attention for hepatitis often requires frequent visits to a healthcare provider. Below is a list of possible resources for aid with transportation. This list is not exhaustive. There are likely other resources throughout the state.

Indiana Family Helpline (IFHL)

The primary focus of the Indiana Family Helpline is to address questions relating to social service related concerns of callers throughout the state of Indiana. Callers' needs are assessed by trained Communication Specialists, referred to the appropriate community resource(s) accessed through the county-specific computer resource database that presently contains over 10,000 resources.

Toll Free Phone Number: 1-855-HELP-1st (1-855-435-7178)

Days and Hours of Operation: Monday – Friday, 7:30am – 5:00pm

Web address: IFHL.ISDH.IN.gov

American Red Cross

The American Red Cross of Greater Indianapolis provides reliable transportation to get to and from preventative and lifesaving medical appointments such as dialysis, chemotherapy and prenatal exams. Transportation is offered in Boone, Clinton, Hamilton and Marion Counties free of charge and on a referral basis.

Refer a patient

Individuals may be eligible for this program if they do not have access to reliable transportation and are: ineligible for Medicaid, unable to use public transportation or receiving prenatal care.

Physicians, social workers and medical clinics may contact the Greater Indianapolis Red Cross to establish a referral.

To refer a patient who lives in:

- Boone County, please call (888) 684-1441, ext. 338
- Clinton County, please call (888) 684-1441, ext. 338
- Hamilton County, please call 317-773-0380
- Marion County, please call 317-684-4337

Patient Assistance Programs

Patient assistance programs are run by pharmaceutical companies to provide free medications to people who cannot afford to buy their medicine. Pharmaceutical companies have a long-standing tradition of providing prescription medicines free of charge to physicians whose patients might not otherwise have access to necessary medicines. Pharmaceutical companies operate these programs, commonly referred to as patient assistance programs, voluntarily. Many drug manufacturers offer patient assistance programs, which can greatly decrease or entirely eliminate the costs of many medications.

RxAssist Directory of Patient Assistance Programs:

RxAssist offers a comprehensive database of these patient assistance programs, as well as practical tools, news, and articles so that health care professionals and patients can find the information they need. All in one place: www.rxassist.org

Partnership for Prescription Assistance

The Partnership for Prescription Assistance brings together America's pharmaceutical companies, doctors, other health care providers, patient advocacy organizations and community groups to help qualifying patients who lack prescription coverage get the medicines they need through the public or private program that's right for them. Many will get them free or nearly free. Organizations collaborating on this program include, the American Academy of Family Physicians, the American Autoimmune Related Diseases Association, the Lupus Foundation of America, the NAACP, the National Alliance for Hispanic Health and the National Medical Association. To access the Partnership for Prescription Assistance by phone, you can call toll-free, 1-888-4PPA-NOW / 1-888-477-2669 www.pparx.org

Please note that the requirements for program eligibility vary. Some programs may be applied for directly by the patient, whereas other program applications must be initiated by the healthcare provider (physician, pharmacist or agency). Below are a few telephone numbers you can call to ask questions.

Hepatitis and Harm Reduction

Harm Reduction Coalition

The Harm Reduction Coalition is committed to reducing drug-related **harm** among individuals and communities by initiating and promoting **harm reduction** education, interventions, and community organizing.

<http://www.harmreduction.org/>

Harm Reduction Journal

Harm Reduction Journal is an Open Access, peer-reviewed, online journal whose focus is prevalent patterns of psychoactive drug use, the public policies meant to control them, and the search for effective methods of reducing the adverse medical, public health, and social consequences associated with both drugs and drug policies.

ISDH Quick Fact Sheet on Hepatitis A

About...Hepatitis A

What is hepatitis A?

Hepatitis (hep-ah-TY-tiss) A is a vaccine-preventable inflammation of the liver caused by the Hepatitis A virus, which is found in the stool of an infected person. Hepatitis A virus is not found in animals. Hepatitis A rarely causes long-term liver damage or death.

What are the symptoms of hepatitis A?

Symptoms usually begin 28-30 days (range of 15-50 days) after exposure and usually last less than 2 months. People are most contagious from about 2 weeks before symptoms begin until 2 weeks after. Some people, especially children, may have no symptoms, but can still spread the virus to others. Symptoms include:

- Diarrhea
- Nausea
- Vomiting
- Tiredness
- Stomach pain
- Fever
- Dark urine
- Pale, clay-colored stool
- Loss of appetite
- Yellowing of skin and eyeballs (jaundice)

How is hepatitis A spread?

Hepatitis A virus is passed in the stool and people become infected by having contact with the stool of an infected person (fecal-oral route). For this reason, the virus is more easily spread in areas where there are poor sanitary conditions or where good personal hygiene is not common. Casual contact, as in the usual workplace or school setting, does not spread the virus.

Who is at risk for getting hepatitis A?

Anyone can become ill, but young children, senior adults, pregnant women, and immune suppressed individuals (such as patients on cancer drugs and with organ transplants) are at high risk for illness. Persons are at risk for hepatitis A infection if they:

- Drink or swallow untreated water.
- Eat food prepared by an infected person.
- Eating raw produce or raw shellfish (e.g., oysters).
- Traveling to countries where hepatitis A is common and where there is little clean water or proper sewage disposal.
- Exposure to the stool or blood of an infected person.

How do I know if I have hepatitis A?

A person having diarrhea lasting more than 24 hours or have jaundice should consult a health care provider immediately. The health care provider may collect a blood sample to test for hepatitis A.

How is hepatitis A treated?

There is no treatment for hepatitis A other than treating symptoms. People who have had hepatitis A develop lifelong immunity and cannot get hepatitis A again.

How is hepatitis A prevented?

In general, hepatitis A can be prevented by strictly adhering to the following guidelines:

- Get vaccinated for hepatitis A
- Wash hands with soap and water after using the restroom; after swimming; and before, during, and after food preparation.
- Wash all produce before eating raw or cooking.
- Use treated water for washing, cooking, and drinking.
- Do not change diapers near recreational water.
- When traveling outside the United States, drink bottled drinks, do not eat uncooked produce unless you peel them yourself, do not eat foods or drinks from street vendors, and do not drink or eat local water or ice.

All information presented is intended for public use. For more information, please refer to: <http://www.cdc.gov/hepatitis/A/index.htm>.

ISDH Quick Fact Sheet on Hepatitis B

About...Hepatitis B

What is hepatitis B?

Hepatitis B is a serious disease of the liver that can be passed on to other people through certain activities. It is caused by an infection of the hepatitis virus. The disease can range from no signs of illness to a severe chronic infection. Most people will get better and have few problems; but in some people with chronic infections, hepatitis B can lead to severe illness, liver cancer, liver failure, and sometimes death.

How do I know if I have hepatitis B?

Talk to your doctor. Hepatitis B is known as a “silent infection” because you may have very mild or no symptoms. Since many people with hepatitis B do not have symptoms, doctors diagnose the disease by one or more blood tests. People who have hepatitis B will have to continue to have blood tests through their lifetime to determine if the disease is still present in their body.

Symptoms appear six weeks to six months after a person comes in contact with the virus. Symptoms may include:

- Yellowing of the eyes or skin (jaundice)
- Loss of appetite
- Nausea and vomiting
- Fever
- Pale (clay-colored) stool
- Abdominal pain
- Joint pain
- Being very tired
- Dark-colored urine

How is hepatitis B spread?

Hepatitis B virus is spread when blood, semen, or other body fluid that is infected with the hepatitis B virus enters the body of a person who is not infected. Even though many people do not know they are infected, they can still spread the virus to others. Examples of ways that people can be infected include:

- Having sex with an infected partner and not using a condom
- Sharing needles, syringes, or other drug-injection equipment
- Sharing items such as razors, toothbrushes or nail clippers with an infected person
- Traveling to or being born in a country with moderate to high rates of Hepatitis B (Southeast Asia, Africa, the Amazon Basin in South America, the Pacific Islands, Eastern Europe, or the Middle East)
- Being born to a mother who has hepatitis B
- Getting a tattoo or piercing with equipment that isn't sterile
- Coming in contact with the blood or open sores of an infected person

Hepatitis B is not spread through food or water, sharing eating utensils, breastfeeding, hugging, kissing, coughing or sneezing.

How is hepatitis B treated?

There are medications available to treat hepatitis B. In most people, the infection will leave the body by itself. People with chronic hepatitis B should see their doctor to find out if the disease is getting worse and if medications and treatment are needed.

How is hepatitis B prevented?

The best way to prevent hepatitis B is to get the hepatitis B vaccine and avoid the activities that spread the disease. The hepatitis B vaccine is safe and effective and is usually given as 3-4 shots over a 6-month period.

Other things to think about:

- Get tested for hepatitis B if you are pregnant and talk with your doctor about the needed shots for your baby after it's born
- If you are infected with hepatitis B, do not donate blood, organs, semen, or tissue
- Inform your sex or needle sharing partners that you are infected with hepatitis B and that they should be tested
- Everyone living with you should receive the hepatitis B vaccination

All information presented is intended for public use. For more information, please refer to: <http://www.cdc.gov/hepatitis/index.htm> and <http://www.hepb.org/> and <http://www.hepfi.org/> and <http://www.immunize.org/>

ISDH Quick Fact Sheet on Hepatitis C

About...Hepatitis C

What is Hepatitis C?

Hepatitis C is an infectious liver disease caused by the Hepatitis C virus (HCV), which can be either acute or chronic. An acute infection means the illness is short-term and occurs in the first 6 months after being exposed to the virus. A chronic infection means the illness is long-term and occurs when the virus remains in a person's body. Chronic infections may progress over years, even decades, and can lead to liver scarring (cirrhosis), liver cancer, and liver failure.

Hepatitis C is the most common blood-borne disease in the United States and the leading cause for a liver transplant. An estimated 4.1 million people in America have the disease. Each year, about 17,000 Americans become infected with HCV. In Indiana, acute hepatitis C is a reportable disease, and needs to be reported within five (5) business days of diagnosis.

What are the symptoms of Hepatitis C?

Symptoms may include:

- Jaundice (yellowing of skin or eyes)
- Dark urine
- Stomach pain
- Loss of appetite
- Weight loss
- Nausea and vomiting
- Fever
- Tiredness
- Headache

Symptoms usually appear from 2 weeks to 6 months after being exposed. About 80% of people show no symptoms. It is important to keep in mind that even without symptoms, people can still infect others. About 85 percent of people who become infected with Hepatitis C will become chronic carriers.

How is Hepatitis C spread?

Hepatitis C is spread mainly by direct contact with infected human blood. It is not spread by touching or sharing eating and drinking utensils. You may have been exposed to Hepatitis C if:

- You have ever shared equipment to inject street drugs or other drugs. These items include syringes, cookers and cotton, which may have been contaminated with blood.
- You received blood, blood products, or solid organ transplants before 1992.
- You ever received long-term kidney dialysis.
- You were ever a health care worker who had frequent contact with blood or had a needle stick injury.
- Your mother had Hepatitis C at the time she gave birth to you.

- You ever shared personal items, like a razor or toothbrush, with a person who had Hepatitis C.
- You ever had unprotected sex with a person who had Hepatitis C.
- You ever received a tattoo from a person that may have used dirty needles or had poor sanitary practices.

Who is at risk for Hepatitis C?

- Injection drug users
- Healthcare workers
- People who have multiple sex partners
- Homeless people (risk of drug use, poor hygiene, poor nutrition, and unsafe living conditions)
- Military veterans who served in the Vietnam War era and those who have participated in high risk behaviors such as drug use and unsafe tattooing

How do I know if I have Hepatitis C?

Blood tests can detect whether you have Hepatitis C. Also, your health care provider may suggest that you be tested for Hepatitis C based on your symptoms (if any) and any risk factors you may have.

How can Hepatitis C be treated?

The most common treatment for Hepatitis C is a combination therapy of ribavirin and interferon. In recent years, there has been great progress in the number and types of treatment options available. Your health care provider will decide which treatment options are best for you. Between 15 – 25% of people who get Hepatitis will clear the virus from their bodies without treatment and not develop chronic infection. It is not fully understood why this happens for some people.

There is currently no vaccine for Hepatitis C. However, if you have Hepatitis C, you should be vaccinated against Hepatitis A and Hepatitis B to prevent those infections.

There are many ways you can be exposed to the Hepatitis C virus. Some ways to avoid transmission are:

- Don't share needles or syringes
- Don't share a toothbrush or razors
- Practice safe sex and use a condom
- Use licensed tattoo and piercing studios

All information presented here is intended for public use. For more information, please refer to:

Hepatitis B Testing Recommendations and Test Results

Recommendations for Routine Testing and Follow-up for Chronic Hepatitis B Virus (HBV) Infection

Population	Recommendation	
	Testing	Vaccination/Follow-up
Persons born in regions of high and intermediate HBV endemicity (HBsAg prevalence $\geq 2\%$)	Test for HBsAg, regardless of vaccination status in their country of origin, including <ul style="list-style-type: none"> – immigrants – refugees – asylum seekers – internationally adopted children 	If HBsAg-positive, refer for medical management. If negative, assess for on-going risk for hepatitis B and vaccinate if indicated.
US born persons not vaccinated as infants whose parents were born in regions with high HBV endemicity ($\geq 8\%$)	Test for HBsAg regardless of maternal HBsAg status if not vaccinated as infants in the United States.	If HBsAg-positive, refer for medical management. If negative, assess for on-going risk for hepatitis B and vaccinate if indicated.

Continues on back

Geographic Distribution of Chronic HBV Infection — Worldwide, 2006*

* For multiple countries, estimates of prevalence of hepatitis B surface antigen (HBsAg), a marker of chronic HBV infection, are based on limited data and might not reflect current prevalence in countries that have implemented childhood hepatitis B vaccination. In addition, HBsAg prevalence might vary within countries by subpopulation and locality.

Source: CDC. Travellers' Health; Yellow Book. <http://www.cdc.gov/travel/yellowbookch4-HepB.aspx>.

Routine Testing and Follow-up for Chronic HBV Infection (continued)

Population	Recommendation	
	Testing	Vaccination/Follow-up
Injection-drug users	Test for HBsAg, as well as for anti-HBc or anti-HBs to identify susceptible persons.	First vaccine dose should be given at the same visit as testing. Susceptible persons should complete a 3-dose hepatitis B vaccine series to prevent infection from ongoing exposure.
Men who have sex with men	Test for HBsAg, as well as for anti-HBc or anti-HBs to identify susceptible persons.	First vaccine dose should be given at the same visit as testing. Susceptible persons should complete a 3-dose hepatitis B vaccine series to prevent infection from ongoing exposure.
Persons needing immunosuppressive therapy, including chemotherapy, immunosuppression related to organ transplantation, and immunosuppression for rheumatologic or gastroenterologic disorders	Test for all markers of HBV infection (HBsAg, anti-HBc, and anti-HBs).	Treat persons who are HBsAg-positive. Monitor closely persons who are anti-HBc positive for signs of liver disease.
Persons with elevated ALT/AST of unknown etiology	Test for HBsAg along with other appropriate medical evaluation.	Follow-up as indicated.
Donors of blood, plasma, organs, tissues, or semen	Test for HBsAg, anti-HBc, and HBV-DNA as required.	
Hemodialysis patients	Test for all markers of HBV infection (HBsAg, anti-HBc, and anti-HBs). Test vaccine nonresponders monthly for HBsAg. HBsAg-positive hemodialysis patients should be cohorted.	Vaccinate against hepatitis B to prevent transmission and revaccinate when serum anti-HBs titer falls below 10mIU/mL.
All pregnant women	Test for HBsAg during each pregnancy, preferably in the first trimester. Test at the time of admission for delivery if prenatal HBsAg test result is not available or if mother was at risk for infection during pregnancy.	If HBsAg-positive, refer for medical management. To prevent perinatal transmission, infants of HBsAg-positive mothers and unknown HBsAg status mothers should receive vaccination and postexposure immunoprophylaxis in accordance with recommendations and within 12 hours of delivery.
Infants born to HBsAg-positive mothers	Test for HBsAg and anti-HBs 1–2 mos after completion of at least 3 doses of a licensed hepatitis B vaccine series (i.e., at age 9–18 months, generally at the next well-child visit to assess effectiveness of postexposure immunoprophylaxis). Testing should not be performed before age 9 months or within 1 month of the most recent vaccine dose.	Vaccinate in accordance with recommendations.
Household, needle-sharing, or sex contacts of persons known to be HBsAg positive	Test for HBsAg, as well as anti-HBc or anti-HBs to identify susceptible persons.	First vaccine dose should be given at the same visit as testing. Susceptible persons should complete a 3-dose hepatitis B vaccine series to prevent transmission from ongoing exposure.
Persons who are the sources of blood or body fluids resulting in an exposure (e.g., needlestick, sexual assault) that might require postexposure prophylaxis	Test source for HBsAg.	Vaccinate healthcare and public safety workers with reasonably anticipated occupational exposures to blood or infectious body fluids. Provide postexposure prophylaxis to exposed person if needed.
HIV-positive persons	Test for HBsAg, as well as for anti-HBc or anti-HBs to identify susceptible persons.	Vaccinate susceptible persons against hepatitis B to prevent transmission.

Interpretation of Hepatitis B Serologic Test Results

Hepatitis B serologic testing involves measurement of several hepatitis B virus (HBV)-specific antigens and antibodies. Different serologic “markers” or combinations of markers are used to identify different phases of HBV infection and to determine whether a patient has acute or chronic HBV infection, is immune to HBV as a result of prior infection or vaccination, or is susceptible to infection.

HBsAg anti-HBc anti-HBs	negative negative negative	Susceptible
HBsAg anti-HBc anti-HBs	negative positive positive	Immune due to natural infection
HBsAg anti-HBc anti-HBs	negative negative positive	Immune due to hepatitis B vaccination
HBsAg anti-HBc IgM anti-HBc anti-HBs	positive positive positive negative	Acutely infected
HBsAg anti-HBc IgM anti-HBc anti-HBs	positive positive negative negative	Chronically infected
HBsAg anti-HBc anti-HBs	negative positive negative	Interpretation unclear; four possibilities: 1. Resolved infection (most common) 2. False-positive anti-HBc, thus susceptible 3. “Low level” chronic infection 4. Resolving acute infection

Adapted from: A Comprehensive Immunization Strategy to Eliminate Transmission of Hepatitis B Virus Infection in the United States: Recommendations of the Advisory Committee on Immunization Practices. Part I: Immunization of Infants, Children, and Adolescents. MMWR 2005;54(No. RR-16).

DEPARTMENT OF HEALTH & HUMAN SERVICES
Centers for Disease Control and Prevention
Division of Viral Hepatitis

www.cdc.gov/hepatitis

■ Hepatitis B surface antigen (HBsAg):

A protein on the surface of hepatitis B virus; it can be detected in high levels in serum during acute or chronic hepatitis B virus infection. The presence of HBsAg indicates that the person is infectious. The body normally produces antibodies to HBsAg as part of the normal immune response to infection. HBsAg is the antigen used to make hepatitis B vaccine.

■ Hepatitis B surface antibody (anti-HBs):

The presence of anti-HBs is generally interpreted as indicating recovery and immunity from hepatitis B virus infection. Anti-HBs also develops in a person who has been successfully vaccinated against hepatitis B.

■ Total hepatitis B core antibody (anti-HBc):

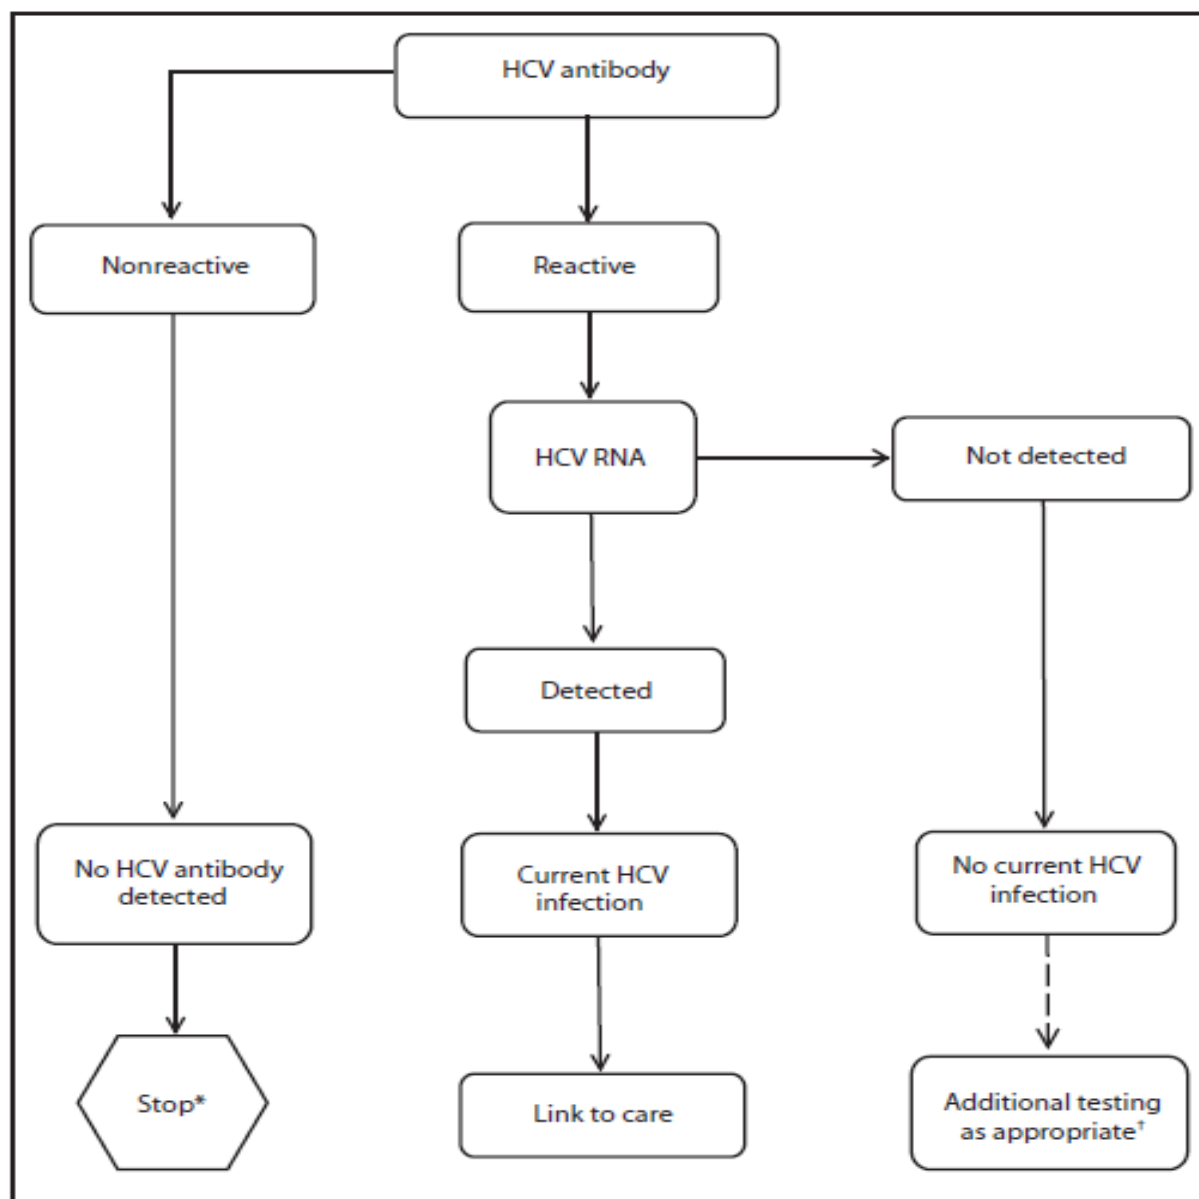

Appears at the onset of symptoms in acute hepatitis B and persists for life. The presence of anti-HBc indicates previous or ongoing infection with hepatitis B virus in an undefined time frame.

■ IgM antibody to hepatitis B core antigen (IgM anti-HBc):

Positivity indicates recent infection with hepatitis B virus (≤ 6 mos). Its presence indicates acute infection.

Hepatitis C Testing Guidelines and Test Results

FIGURE. Recommended testing sequence for identifying current hepatitis C virus (HCV) infection

* For persons who might have been exposed to HCV within the past 6 months, testing for HCV RNA or follow-up testing for HCV antibody is recommended. For persons who are immunocompromised, testing for HCV RNA can be considered.

† To differentiate past, resolved HCV infection from biologic false positivity for HCV antibody, testing with another HCV antibody assay can be considered. Repeat HCV RNA testing if the person tested is suspected to have had HCV exposure within the past 6 months or has clinical evidence of HCV disease, or if there is concern regarding the handling or storage of the test specimen.

Interpretation of Results of Tests for Hepatitis C Virus (HCV) Infection and Further Actions

U.S. Department of
Health and Human Services
Centers for Disease
Control and Prevention

TEST OUTCOME	INTERPRETATION	FURTHER ACTIONS
HCV antibody nonreactive	No HCV antibody detected	Sample can be reported as nonreactive for HCV antibody. No further action required. If recent exposure in person tested is suspected, test for HCV RNA.*
HCV antibody reactive	Presumptive HCV infection	A repeatedly reactive result is consistent with current HCV infection, or past HCV infection that has resolved, or biologic false positivity for HCV antibody. Test for HCV RNA to identify current infection.
HCV antibody reactive, HCV RNA detected	Current HCV infection	Provide person tested with appropriate counseling and link person tested to care and treatment.†
HCV antibody reactive, HCV RNA not detected	No current HCV infection	No further action required in most cases. If distinction between true positivity and biologic false positivity for HCV antibody is desired, and if sample is repeatedly reactive in the initial test, test with another HCV antibody assay. In certain situations,‡ follow up with HCV RNA testing and appropriate counseling.

* If HCV RNA testing is not feasible and person tested is not immunocompromised, do follow-up testing for HCV antibody to demonstrate seroconversion. If the person tested is immunocompromised, consider testing for HCV RNA.

† It is recommended before initiating antiviral therapy to retest for HCV RNA in a subsequent blood sample to confirm HCV RNA positivity.

‡ If the person tested is suspected of having HCV exposure within the past 6 months, or has clinical evidence of HCV disease, or if there is concern regarding the handling or storage of the test specimen.

Source: CDC. Testing for HCV infection: An update of guidance for clinicians and laboratorians. *MMWR* 2013;62(18).
